1 Introduction

Pipe Flow Gas Pressure Drop is a software application developed for iOS that can perform calculations to find the pressure loss of a gas in a single pipe. With an intuitive and easy to use interface, it allows the user to quickly specify the known information, calculate the answer, view the comprehensive results, generate Excel or PDF reports, save and share the calculation.

The required calculation data can be entered manually, leveraging the wide range of metric and imperial units available or selected from the integrated fluid, material, pipe and fitting databases. The software is also backed up by an unrivalled support service that provides help to users when they need it.

1.1 Pipe Flow Gas Pressure Drop Software Overview

Pipeline systems range from single pipelines to very large complex networks with hundreds of interconnecting pipes. They may be simple, carrying water from one reservoir to another reservoir, or they may be complex with many interconnecting pipes that distribute fluid over a large area, or they could fall somewhere in-between such as a system that transfers a fluid from a supply container to a delivery point.

The Pipe Flow Gas Pressure Drop software is designed to calculate pressure loss for a single pipe. It is a useful tool for piping calculations that engineers often need to perform either at the office or out in the field.

Note: Our <u>*Pipe Flow Expert*</u> software can be used to model and calculate flow rates, pressure losses and pumping requirements within a complex pipe system.

The Pipe Flow Gas Pressure Drop calculation panel has a set of data input fields that enable the known information to be entered. This data includes:

- The internal size, roughness and length of the pipe.
- The elevation change between the start and end of the pipe.
- The type, quantity and position of fittings on the pipe.
- The type and characteristics of the gas in the pipe.
- The required flow rate of the gas in the pipe.

Once the known information has been specified for the required calculation, the results can be obtained by tapping Calculate. The results panel slides up and over the inputs panel to concisely display the calculated data which typically includes:

- Friction losses, fitting losses, elevation change gains / losses.
- Flow type, Reynolds number and Friction factor.
- Entry and exit pressures and densities.
- Entry and exit flow rates.
- Total pressures loss.

 $\sum \text{Pipe-FLOW}^{\mathbb{R}}$ cas taking the pressure out of fluid flow calculations Pressure drop

1.2 Device Compatibility

Requires iOS 11.0 or later.

Please see the Compatibility section of Pipe Flow Gas Pressure Drop in the App Store for a full list of compatible devices.

1.3 Licensing Information

Pipe Flow Gas Pressure Drop for iOS is a software package that is provided for use on Apple iOS devices.

Installation

When the software is installed from the App Store, it can be used in Trial Mode.

When in Trial Mode, calculations can be performed however the pipe diameter cannot be changed. In addition, Excel & PDF reports that were produced with a licensed version of the software cannot be viewed.

To enable the above functionality, the software must have a valid License.

To purchase a license, tap the **Buy** button BUY in the footer to display the **License Software** screen, then tap the **Buy Pipe Flow Gas Pressure Drop**.

Figure 1 License Software

Purchasing a License

App purchases are entirely managed by Apple Inc. The license fee will be charged to your iTunes Account at confirmation of purchase. The license fee is a **one-time** cost that provides access to the software for its lifetime.

You require an internet connection when licensing the software. The software does not need an internet connection to operate.

Manage License

If you delete and re-install Pipe Flow Gas Pressure Drop, or install the App on a new device, Pipe Flow Gas Pressure Drop will return to trial mode.

To restore your license, launch Pipe Flow Gas Pressure Drop, tap the **Main Menu** button and then In App Purchases > Restore Purchases.

Additional Devices

The Pipe Flow Gas Pressure Drop software can be downloaded to all your compatible Apple devices.

If you have purchased a license, then this license is valid on all compatible Apple devices that share the same Apple ID (or family sharing).

To enable a license on another device:

Launch Pipe Flow Gas Pressure Drop, tap the **Main Menu** = button and then In App Purchases > Restore Purchases.

Summary

- The Pipe Flow Gas Pressure Drop software can be downloaded and installed for a free trial.
- A license can be purchased via the Apple App Store In App Purchase that will enable use of the software for its lifetime.
- A user can be up and running with a licensed version of the software within a few minutes.
- Software support and maintenance, including technical assistance, help with modeling issues and free upgrades to new releases, are provided for free while you are running a licensed copy of the Pipe Flow Gas Pressure Drop software.

1.4 Contacting Pipe Flow Software

Email:	support@pipeflow.com
Internet:	www.pipeflow.com

UK Telephone: +44 (0)161 408 3569

USA Telephone: +1 650-276-3569 +1 650-276-FLOW

Pipe Flow Software, PipeFlow.com and PipeFlow.co.uk are trading names of Daxesoft Ltd, a U.K. Registered Company.

1.5 Additional Pipe Flow Software Programs

1.5.1 Mobile - iPhone and iPad

Single pipe liquid pressure drop and flow rate calculators:

- Pipe Flow Liquid Pressure Drop
- Pipe Flow Liquid Flow Rate
- Pipe Flow Liquid Pipe Length
- Pipe Flow Liquid Pipe Diameter

Single pipe gas pressure drop and flow rate calculators:

- <u>*Pipe Flow Gas Pressure Drop*</u> (This software program)
- Pipe Flow Gas Flow Rate
- Pipe Flow Gas Pipe Length
- Pipe Flow Gas Pipe Diameter

Pipe Flow GasRef – gas properties calculator

<u>*Pipe Flow GasRef*</u> can be used to calculate the density, z compressibility, viscosity, specific heat ration at different temperature and pressure conditions for a number of common gases.

1.5.2 Desktop – Windows & MacOS

Pipe Flow Expert - for designing piping and pumping systems (Windows)

Pipe Flow Expert can be used to model pipe systems with just a few pipes through to more complex systems with many hundreds of pipes, with multiple supply points, multiple discharge points, and multiple pumps running in series or in parallel.

For more information about Pipe Flow Expert, see:

www.pipeflow.com/pipe-flow-expert-software

Pipe Flow Wizard – Flow Rate and Pipe Pressure Drop Calculators (Windows & MacOS)

Pipe Flow Wizard software makes it easy to calculate pressure loss, flow rate, size a pipe diameter and calculate pipe length. It allows users to perf 'What If?" calculations on both liquids and gases flowing in a single length of pipe between a start and end elevation, when pipe fittings can be added to represent valves and bends.

For more information about Pipe Flow Wizard, see:

https://www.pipeflow.com/pipe-flow-wizard-software

Pipe Flow Advisor - for Channels and Tanks (Windows)

Pipe Flow Advisor may be used to estimate water flow rate from various shaped channels and tanks. It can calculate:

- Open Channel Flow
- Water Flow Rates
- Time taken to empty tanks
- Volume, Capacity, Weight and Expansion

For more information about Pipe Flow Advisor, see

www.pipeflow.com/pipe-flow-advisor-software

All desktop software program can be downloaded for a free trial by visiting:

www.pipeflow.com

Once you have installed a trial version of one of our software products it can be fully enabled and licensed by buying a license code from our web site. You can be up and running with a fully licensed program within just a couple of minutes.

2 Interface and Menus

This section details the different features of the Pipe Flow Gas Pressure Drop interface. For each feature, there is an explanation, a screen shot and a table providing descriptions for each element of the feature. The following sections provide instructions for using the Pipe Flow Gas Pressure Drop application.

Figure 7 Calculation Panel

The Material name, Schedule and Internal roughness of the pipe can be specified

by tapping the **Pipe** button to open the **Pipe Material** screen from where a material can be selected from the database or a new material defined. For more information about working with pipe materials, see: <u>Pipe Material & Diameters</u>.

The **Internal diameter** of the pipe can be specified by tapping the **Diam**. button to open the **Pipe Diameter** screen from where a pipe size can be selected from the database or a new size defined. For more information about working with pipe diameters, see: <u>Pipe Material & Diameters</u>.

Fittings can be added to the pipe by tapping the **Fittings** button to open the **Fitting Screen** from where fittings can be selected, or new fittings defined. For more information about working with fittings, see: <u>Fittings & Valves.</u>

The pipe's **Elevation** change can be specified by entering the difference in height from the start of the pipe to the end of the pipe in the **Elevation Change** field and specifying whether this is a rise or fall.

The **Gass** in the pipe can be specified by tapping the **Gases** button to display the Fluid Database. For more information about working with fluids, see:

Fluids Database.

The **Flow** rate of the fluid can be specified by entering the value into the **Flow** field

or tapping the expander button to open the **Flow Rate Calculator**. For more information about entering a flow rate based on a velocity using the **Flow Rate Calculator**, see: <u>Flow Rate Calculator / Helper</u>.

Tap the **Calculate** button to solve the calculation using the data supplied.

The **Results Panel** will slide up and over the calculation panel to display the results of the calculation. For more information about the Results Panel, see: <u>Results</u> <u>Panel</u>.

Depending upon the amount of information in the calculation panel and/or the height of the program window, it may be necessary to scroll down to reveal further information.

2.3 Results Panel

When a calculation is solved, the **Results Panel** slides up and over the **Calculation Panel**.

Figure 8 Results Panel

The results panel displays the data that was entered by the user at the top in the 'Calculation Inputs' section and displays the results beneath the inputs in the 'Calculation Results' section.

The display unit for each different item of data can be changed in Settings. In addition, for the main result the display unit can be changed by selecting the unit from the drop-down list. When the result panel is closed, and another calculation is performed, the result unit will be reset to the unit that is specified in settings for that attribute. For more information about setting units, see: <u>Units</u>.

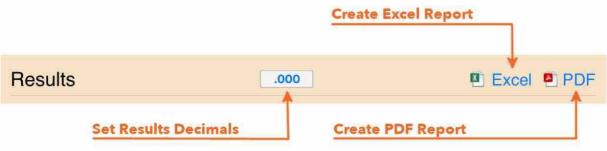

Tapping the expander button for a result attribute will reveal further data associated with that attribute. For further information about expanders, see: Expandable Sections.

2.3.1 Results Menu Bar

In the header of each result panel is the results menu bar.

The menu bar contains three buttons which provides quick access to:

Menu Items	Description
.000	Setting the decimals for the results. For more information about results decimals, see: <u>Results</u> <u>Decimals</u> .
X	Creating and viewing an Excel Report. For more information about Excel Reports, see: Creating a Report of the Results.
<u>A</u>	Creating and viewing a PDF Report. For more information about PDF Reports, see: Creating a Report of the Results.

 Depending upon the amount of information in the result panel and/or the height of the program window, it may be necessary to scroll down to reveal further information.

2.4 Results Share Action Sheet

In the footer of each result panel is the status bar. Tap the **Share** the **Share** button to open the **Share Action Sheet**.

í.	Share Calculation	
	Save Calculation

	Cancel	

Figure 10 Results Share Action Sheet

Menu Items	Description
Share Calculation	Opens the iOS Share Action Sheet to allow the calculation to be exported from the device (e.g. via AirDrop, mail, DropBox etc.). For more information about sharing calculations, see: <u>Sharing a Calculation</u> .
Save Calculation	Saving the calculation to the local storage on the device. For more information, see <u>Saved</u> Files.
Create Excel Report	Create and view an Excel Report. For more information about Excel Reports, see: <u>Creating a Report of the Results</u> .
Create PDF Report	Create and view a PDF Report. For more information about PDF Reports, see: Creating a Report of the Results.
Cancel	Close the Share action sheet.

2.5 Expandable Sections

Pipe Flow Gas Pressure Drop uses expandable sections to allow the user to increase or reduce the information that is displayed.

Sections that can be expanded display the expander button \blacktriangleright which when tapped will expand the section to reveal more information.

Tapping the expander button when the section is expanded will collapse the section.

3.1.1 Rate on the App Store

To provide a rating and/or review of Pipe Flow Gas Pressure Drop on the Apple App

Store, tap the Main Menu \equiv button, Settings > Pipe Flow Gas Pressure Drop \bigotimes and then the Rate on the App Store menu item.

The App Store application on your device will be launched and the Pipe Flow Gas Pressure Drop App display from where you can leave a review / rating.

3.1.2 Recommend Pipe Flow Gas Pressure Drop

To easily recommend Pipe Flow Gas Pressure Drop to a friend or colleague, tap the **Main Menu** \equiv button, **Settings** > **Pipe Flow Gas Pressure Drop** \bigcirc and then the **Recommend Pipe Flow Gas Pressure Drop** menu item.

The Mail application on your device will be launched and new Email prepared containing some default text and a link to download the Pipe Flow Gas Pressure Drop.

Enter the email addresses of the people you wish to send the recommendation to and edit the body text as needed, then tap Send.

3.1.3 Reset

The **Reset** screen is displayed by tapping the **Main Menu** \equiv button, **Settings** > **Pipe Flow Gas Pressure Drop** \bigcirc and then the **Reset** menu item.

4 File and Calculation Operations

4.1 Filename Extension

The filename extension for the Gas Pressure Drop calculation is .pfgdp

4.2 Saving a Calculation

When on the results panel of a calculation, tap **Save Calculation** to display the filename dialog. It is not necessary to add a file extension. The filename will be prepopulated with a default filename, alternatively this can be cleared / overtyped with your own filename.

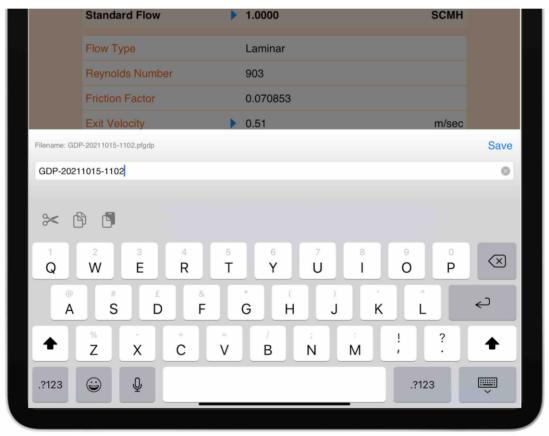

Figure 22 Save Dialog

Saved calculations are stored on your device and can be accessed by tapping **Saved Files** on the **Main Menu.**

4.3 Saved Files

The **Saved Files** screen displays all calculations that have been saved to your device. The file list can be sorted date ascending or descending.

Tap on a row in the list to load the calculation.

Action Button	Description
More	Displays the more action sheet with options to create an Excel or PDF report.
Share	Displays the iOS Share Action Sheet so that the calculation can be shared with other Pipe Flow Gas Pressure Drop users (on any device).
Delete	Delete the selected file from your device. A confirmation dialog will be displayed to confirm the file deletion. Once deleted, the file cannot be recovered.

4.3.1 Export / Backup all Files

To export / backup all calculation files on your device, tap the button to display the **Share Action** sheet and tap **Export all Calculations.** Pipe Flow Gas Pressure Drop will create a compressed folder (zip) containing all the calculation files and then display the **iOS Share Action** sheet from where you can select how to share the zip file. For example, you can select to send the zip file via e-mail or use a third-party cloud service such as Drop Box.

4.4 Sharing a Calculation

The calculation data can be shared with other Pipe Flow Gas Pressure Drop users (on any device).

To share a calculation, tap the **Share** button to display the associated action sheet. This will be either the Results Panel Share Action Sheet (depending upon the current panel shown) or the Calculation Panel Share Action Sheet.

Share Calculation	1

Tap Share Calculation to show the iOS Share Action Sheet.

Tap the required method of sharing the calculation.

The options / applications available on the iOS Share Sheet will depend upon the applications installed on the device and how the share sheet is configured.

4.5 Loading a Calculation

Calculations that have been saved on your device, or that have been shared with you (e.g. via email) can be opened in Pipe Flow Gas Pressure Drop.

4.5.1 Load Calculation from Saved Files

The Saved Files screen is displayed by tapping the **Main Menu** \equiv button, then **Saved Files.** For more information, see: <u>Saved Files</u>.

Tap the required calculation in the list to load it from your device.

4.5.2 Load Calculation from Shared File

A calculation that has been shared (e.g. via email) can be opened in Pipe Flow Gas Pressure Drop.

- 1. Open the e-mail that contains the Pipe Flow Gas Pressure Drop attachment. For more information on the type of files Pipe Flow Gas Pressure Drop uses see: <u>Filename Extension</u>.
- 2. Tap the attachment to open the **iOS Share Sheet**.
- 3. Tap Copy to Pressure Drop
- If the **Copy to Pressure Drop** option is not immediately available, it may be necessary to swipe the applications to the left.

4.5.3 Display Filename of Loaded Calculation

When a calculation has been loaded from a file, a blue information icon appears next to the app title.

Tapping the app title or the blue information icon will display the name of the loaded file in a temporary notification.

5 Pressure Drop Calculation

The **Pressure Drop** through the pipe can be calculated when the following values are known:

- Pipe internal roughness
- Pipe internal diameter
- Pipe length
- Pipe elevation change
- Fittings
- Flow rate

For more information about working with gases, see: <u>Working with Compressible</u> <u>Fluids</u>.

For more information about the theory and formulas used to calculate the flow rate, see: <u>Calculation Theory and Method of Solutions</u>.

The pressure drop for a gas in a pipe can be calculated as follows:

Figure 29 Gas Pressure Drop Calculation

- Select or define the Material and Internal Roughness of the pipe. For more information about working with pipe materials, see: <u>Pipe Material &</u> <u>Diameters</u>.
- 2. Select or define the **Internal Diameter** of the pipe. For more information about working with pipe diameters, see: <u>Pipe Material & Diameters</u>.
- 3. Set the Length and Elevation Change of the pipe.
- 4. Add **Fittings** to the pipe if required. For more information about working with fittings, see: <u>Fittings & Valves</u>.
- 5. Select the **Gas** in the pipe. For more information about working with fluids, see: <u>Fluids Database</u>.
- 6. Enter the **Pressure** of the fluid at the start of the pipe.
- 7. Enter the **Flow Rate** of the fluid in the pipe. For more information about setting a flow rate based on a velocity, see: <u>Flow Rate Calculator / Helper</u>.
- 8. Tap Calculate Pressure Drop and the Results panel will slide up.

The internal diameter will be reset to 1.049" (26.64 mm) if running the trial version of Pipe Flow Gas Pressure Drop.

The **Gas Pressure Drop Results Panel** displays the calculation input data and the results of the **Pressure Drop** calculation. For more information about the Results Panel, see: <u>Results Panel</u>.

Figure 30 Gas Pressure Drop Results

The pressure loss unit can be changed as required. To change the pressure loss unit for all subsequent calculations, the pressure loss unit can be specified in Settings > Units. For more information about setting units, see: <u>Units</u>

To generate and view an Excel or PDF Report of the results, tap the Excel ^{III} button or PDF ^{III} button. For more information about generating reports, see: <u>Creating a</u> <u>Report of the Results</u>.

To close the **Results Panel**, tap the **Close** button in the **Navigation Bar** or the **Close Results** button at the bottom.

6 Fluids Database

The Pipe Flow Gas Pressure Drop software includes a fluid database. The Fluid Properties list displays all the fluids available in the gases database. When you are selecting a gas to be used for a calculation, you can select an existing gas, or enter your own gas data. Once entered, new gas data will be displayed in the list of fluids and can then be used just the same as the standard gas data.

To define the fluid and fluid properties for the currently selected calculation:

1. Tap the **Gases** button on the calculation panel to display the gases in the Fluids Database.

Figure 31 Fluid Database - Gases

2. Select the gas contained in the pipe from the **Fluid Database** list. The name of the gas is displayed in the calculation next to the gases button.

6.1 Adding Gases to the Fluid Database

If the gas you are using does not exist in the Pipe Flow Gas Pressure Drop fluid database, you can quickly add the gas to the database by tapping the Add Gas button on the Fluid Database screen.

NOTE: Be sure to enter the value for the gases properties in the units displayed in the column header. For example, if you are using imperial units, °F for Fahrenheit is displayed under Temperature in the Temperature column. The temperature value in this case should be entered in degrees Fahrenheit.

To add a new gas to the fluid database:

- 1. Tap the **Gases** button on the calculation panel to display the Fluids Database Action Sheet.
- 2. Select **Gases** from the action sheet to display the list of standard gases.
- 3. Tap Add New Fluid and then select Use Gas Calculator or Use Own Data.

7 Pipe Material & Diameters

Pipe Flow Gas Pressure Drop includes a database of common pipe materials for which a range of pipe characteristics (internal roughness, nominal size and internal diameter) are defined.

If the pipe you are using does not exist in the database, then its characteristics can be entered manually and optionally added to the database.

7.1 Selecting a Pipe Material

To select a pipe material:

1. Tap the on the **Pipe** button on the calculation panel to open the **Pipe Material** screen.

- 3. Enter the Name, Schedule / Class, and Internal Roughness values.
- 4. Tap the **Save Material** button to save the new material to the database.

7.4 Selecting a Pipe Diameter

To select a pipe diameter:

1. Tap the **Diam**. button on the calculation panel to open the **Pipe Diameter** screen.

(9:41 AM Tue Oct 30	0 0 0	중 100% ■

- 3. Specify the Nominal Size and Internal Diameter values.
- 4. Tap the **Save Size** button. Note: Pipe Flow Gas Pressure Drop will verify that the Nominal Size value and Internal Diameter value are equivalent, and if not, will prevent the new pipe diameter from being saved.

8 Fittings & Valves

Up to five different fitting types can be added to a pipe. Multiple fittings of each type can be specified, and each fitting type can be selected to be at the start or end of the pipe.

Fittings can be selected from the Pipe Flow Gas Pressure Drop Fitting database, or user fittings can be created using an appropriate K value.

8.1 Adding a Fitting to the Pipe

3. To change the symbol representing the fitting, tap the **Change** button to open the **Choose Symbol** screen.

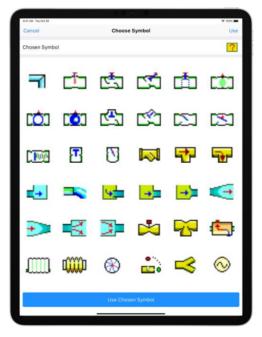

Figure 45 Choose Fitting Symbol

4. Select the symbol you want to represent the fitting.

- 1. Tap **Use Chosen Symbol** to add the symbol to the **Symbol** field and close the **Choose Symbol** screen.
- 2. Select the fitting's metric size from the **Metric** list or select the fitting's imperial size from the **Imperial** list.
- 3. You only need to select the metric or imperial fitting size. The Pipe Flow Gas Pressure Drop software automatically populates the other size for you. For example, if you select 32mm from the **Metric** list, the imperial equivalent, 1-1/4", automatically appears in the **Imperial** field.
- 4. Enter a description of the fitting in the **Description** field.
- 5. Enter the K value for the fitting in the K Value field.
- 6. Tap the **Save Fitting** to add the fitting to the **Fitting Database** list.
- Scroll down to reveal additional symbols.

9 Flow Rate Calculator / Helper

Pipe Flow Gas Pressure Drop incorporates a Flow Rate Calculator which uses the current internal diameter and a fluid velocity to calculate a flow rate.

To open the Flow Rate Calculator:

1. Tap the Flow 🕨 expander button:

low 🔻 (Standard Volume)				
10	0	SCMH 🔻	Gas Fl	w wc
Entry Velocity				
1.5		0	m/sec	*
Flow = 2.959585 SCMH				
Cancel	i i		OK	

Figure 46 Flow Calculator

- 2. Enter the required Velocity.
- 3. As you enter the **Velocity**, Pipe Flow Gas Pressure Drop automatically calculates the **Flow Rate** and displays it beneath the velocity.
- 4. Tap **OK** to apply the calculated flow rate and close the **Flow Rate Calculator.**
- Whilst the **Flow Rate Calculator** is open, no other operations can be performed in the calculation panel.

10 Calculations and Results

Once you have entered the required input data to a <u>Calculation Panel</u>, you can calculate the results for by tapping the **Calculate** button. If the input data is valid, the <u>Results Panel</u> slides up and over the Calculation Panel to concisely display the calculated data.

The values in the results panel can be scrolled up and down as needed, and where applicable, a result value can be expanded to reveal additional information related to that attribute. For more information about expanding attributes, see: <u>Expandable</u> <u>Sections.</u>

10.1 Automatic Checks and Updates

Before a calculation is solved, the software performs some automatic checking of the input data and allows users to accept various recommended updates to the make the calculation data consistent.

10.1.1 Fitting Sizes

Fitting sizes will be checked and matched to the nominal pipe size.

9.41 AM Two Oct 30		Yes - Update Sizes
There are fittings with nominal sizes that do not match the pipe's nominal size.		No - Don't Update Sizes
Do you wish to automatically update the fitting sizes? NOTE: User defined fittings cannot be updated automatically.]	Cancel
U	earn More	

(i)

If the nominal pipe size does not match some of the fitting sizes associated with the pipe, then the option to update the fittings sizes should normally be accepted. This will update the fitting sizes and the fitting 'K' values so that the correct data for the given pipe size is used, such that the pressure losses will be appropriately calculated.

Pipe Flow Gas Pressure Drop cannot automatically update fitting sizes for user defined fittings.

10.2 Configuring the System Results

Once a calculation has been solved, the calculated results are displayed in the <u>Results Panel</u>. The options selected in the <u>Results Decimals</u> and <u>Units</u> sections of Settings determine how the results values are displayed.

10.3 Creating a Report of the Results

When a calculation has been solved and the **Results Panel** displayed, an Excel or PDF report can be created.

To create an Excel Report, tap the **Excel** button. The report will be generated using the defined <u>Reports</u> settings and the Pipe Flow Gas Pressure Drop software will attempt to open it using **Microsoft Excel** (or compatible software) that is installed on your computer.

To create a PDF Report, tap the **PDF** button. The report will be generated using the defined <u>Reports</u> settings and Pipe Flow Gas Pressure Drop will attempt to open it using **Adobe Acrobat** (or compatible software) that is installed on your computer.

The options selected in the <u>Results Decimals</u>, <u>Units</u> and <u>Reports</u> sections of Settings determine how the results values are displayed.

11 Working with Compressible Fluids

The Pipe Flow Gas Pressure Drop software contains a Compressible Isothermal Flow Calculation Engine.

In a gas system, as pressure loss occurs along a pipe, the gas density will decrease, and the volume of the gas will expand. As the volume of gas increases, the velocity of the gas in the pipe will increase. Although the volume of gas and velocity in the pipe changes, the mass flow (weight of flow) in the pipe will remain constant.

Gas flow rates are therefore often referred to in terms of mass flow (weight of flow) or standard volume (which is the volume of gas at standard conditions, normally atmospheric pressure and some common temperature reference, since this standard volume also defines a constant mass flow).

Pipe Flow Gas Pressure Drop provides a choice of standard volume units for gas flow rate which include:

- SCCM (Standard Cubic Centimetres per Minute),
- SLM (Standard Litres per Minute),
- SCMH (Standard Cubic Meters per Hour)
- MMSCMH (Million Standard Cubic Meters per Hour)
- MMSCMD (Million Standard Cubic Meters per Day)
- SCFM (Standard Cubic Feet per Minute)
- SCFH (Standard Cubic Feet per Hour)
- SCFD (Standard Cubic Feet per Day)
- MMSCFH (Million Standard Cubic Feet per Hour)
- MMSCFD (Million Standard Cubic Feet per Day)

Each of the standard volume units for gas flow relate to the gas at a standard condition, however there are several slightly different standard reference conditions that are used worldwide depending on country and location. Pipe Flow Gas Pressure Drop provides a choice of standard reference conditions to be used when referring to the standard volume flow rate of gas and these include:

- 0°C, 100.000 kPa.a
- 0°C, 101.325 kPa.a
- 15°C, 101.325 kPa.a
- 20°C, 101.325 kPa.a
- 25°C, 101.225 kPa.a
- 60°F, 14.696 psi.a
- 68°F, 14.696 psi.a

Mass flow can also be used to refer to an amount of gas flow and the units for mass flow include:

- kg/sec
- kg/min
- kg/hour
- lb/sec
- Ib/min
- lb/hour

11.1 Defining Gas Data

The calculations incorporate use of the Ideal Gas Law and if required a custom Compressibility Factor or use of the CNGA Compressibility Factor (that is calculated based on the pressures at the start and end of the pipe).

The Compressible Flow Calculation Engine will automatically take account of pressure changes within the pipe and will automatically adjust the density properties of the gas as appropriate when performing the gas flow rate, pressure loss, diameter size, and pipe length calculations. The equations used in the calculations currently assume isothermal flow where there is no change in temperature.

The Pipe Flow Gas Pressure Drop software will automatically account for changes in pressure and gas density within the pipe, however the original fluid properties must be defined for the operating temperature within the pipe (although the density may have been specified for a different pressure condition).

Normally the gas properties should be defined for the atmospheric pressure condition (0 bar.g or 0 psi.g) and the software will then automatically calculate the gas density at the start pressure condition prior to performing the appropriate calculation.

If the start pressure is a high pressure, and the real gas density at this condition varies from the ideal gas law prediction, then a compressibility factor other than 1.0 can be specified. This will be applied when calculating the gas density at the start pressure condition prior to performing the appropriate calculation.

11.1.1 Gas Calculator Data

The gas calculator helper within the Fluid Database can calculate and display the compressibility factor of certain gases at different temperature and pressure conditions, and it will show the real density of the gas at the specified condition.

The user should choose to either:

 Define the gas properties at a condition on the ideal gas law line (normally say 0 bar.g) and then specify on the Options screen an appropriate compressibility factor for the pressure condition at the start of pipe.

OR

2. Define the gas properties at the start pressure condition using the real gas density at this pressure (if it differs from the predicted ideal gas law density at this condition) and then specify the compressibility 'Z=1.0'.

This ensures that the calculation proceeds to use the correct real gas density at the start pressure condition.

i.e.

a) If the gas properties are specified on the ideal gas law line then the predicted gas density at the start pressure condition will then be adjusted according to the compressibility factor that has been specified, in order to end up with the real gas density at the start condition.

OR

b) If the gas properties are defined at a high-pressure condition, specifying the real gas density, then a compressibility factor of 'Z=1.0' should be used. The calculated density at the start pressure condition will then be derived from the real gas density (at the high-pressure condition) by applying the ideal gas law equation. This will normally give a good result in terms of predicting the real gas density at the start of the pipe, provided that the defined high-pressure condition and the start pressure are not too different.

This means that the gas properties should generally be specified on the ideal gas law line and a compressibility factor can be specified as appropriate, or if the real gas density is specified for the gas at a high-pressure condition at the start of the pipe then the compressibility factor should be set to 1.0.

11.2 Using Compressible Flow Equations

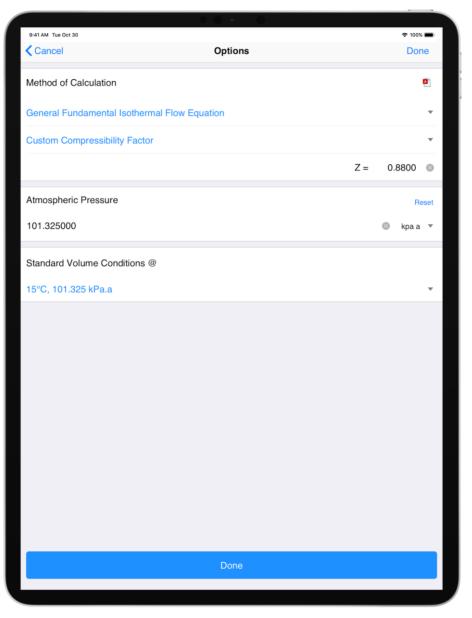

Figure 50 Compressible Flow Equations

There are a number of different equations that can be used to calculate flow rate and pressure loss in a compressible gas system and the type of design and user preference often determines which equation is used to calculate the results.

The Pipe Flow Gas Pressure Drop software allows for the selection of a specific compressible isothermal flow equation from a list that includes:

- General Fundamental Isothermal Flow Equation
- Complete Isothermal Flow Equation
- AGA Isothermal Flow Equation
- Weymouth Isothermal Flow Equation

- Panhandle A Isothermal Flow Equation
- Panhandle B Isothermal Flow Equation
- IGT Isothermal Flow Equation

The General Fundamental Isothermal Flow Equation (sometimes known as just the General Flow equation or the Fundamental Flow equation) provides perhaps the most universal method for calculating isothermal flow rates, however it relies on the inclusion of an accurate friction factor. The Pipe Flow Gas Pressure Drop software provides such a friction factor by calculating this using the Colebrook-White equation.

The preferred method of calculation can be selected from by tapping the **Options**

12 Calculation Theory and Method of Solutions

12.1 Fluid Flow States

Fluids in motion are subjected to various resistance forces, which are due to friction. Friction may occur between the fluid and the pipe work, but friction also occurs within the fluid as sliding between adjacent layers of the fluid takes place.

The friction within the fluid is due to the fluid's viscosity. When fluids have a high viscosity, the speed of the flow tends to be low, and resistance to flow becomes almost totally dependent on the viscosity of the fluid. The condition is known as 'Laminar flow'.

Fluids which have a low viscosity are usually moving at higher velocities. The flow characteristics change, small eddy currents occur within the flow stream, and the friction between the pipe work and the fluid becomes a factor to be considered. This type of flow is known as 'Turbulent flow'.

12.2 Fluid Viscosity

A fluid viscosity can be described by its Dynamic viscosity (sometimes called Absolute viscosity), or it's Kinematic viscosity. These two expressions of viscosity are not the same but are linked via the fluid density.

Kinematic viscosity = Dynamic viscosity / fluid density

Dynamic Viscosity Water @ 20°C has a viscosity of 1.00×10^{-3} Pa • s or 1.00 Centipoise Water @ 70°F has a viscosity of 2.04×10^{-5} lbf •s/ft²

Kinematic Viscosity

Water @ 20°C has a viscosity of 1.004 x 10 $^{\text{-6}}$ m² /s or 1.004000 Centistokes Water @ 70°F has a viscosity of 10.5900 x 10 $^{\text{-6}}$ ft² /s

Pipe Flow Gas Pressure Drop has a database of viscosities and densities for common fluids.

12.3 Reynolds Numbers

Reynolds numbers (Re) describe the relationship between a fluid's velocity, the internal pipe diameter and the fluid's Kinematic viscosity.

Reynolds number = Fluid velocity x Internal pipe diameter / Kinematic viscosity

Note: Kinematic viscosity (not Dynamic viscosity) must be used to calculate Reynolds numbers. It is generally accepted that the 'changeover' point between laminar flow and turbulent flow, in a circular pipe, occurs when the Reynolds number (Re) is approximately 2100.

i.e. Laminar flow occurs when the Re is less than 2100. Turbulent flow occurs when the Re is greater than 4000. Between the Laminar and Turbulent flow conditions the flow may be neither wholly laminar nor wholly turbulent. In this transition region there is no exact equation to calculate the friction factor and therefore only an approximate friction factor can be used by way of appropriate interpolation.

12.4 Friction Factors

Many formulas have been developed to model the flow of liquids. The Hazen-Williams formula has been a popular method of estimating the head loss in piping systems for (particularly prior to the availability of today's modern computers), however, this empirical formula will only give reasonable accuracy if the fluid is water at 60°F or similar and it cannot be used with gases.

The Colebrook-White formula may be used with confidence to calculate an accurate friction factor applicable to the turbulent flow of fluids. The Colebrook-White formula is applicable over a whole range of fluid densities and viscosities, provided that the fluid flow is turbulent i.e. it work with all fluids and not only water.

The Colebrook-White friction factor is used in the Darcy-Weisbach equation when calculating friction loss for non-compressible flow (liquids). The Colebrook-White friction factor is also used with some compressible gas flow equations such as the General Fundamental Flow equation.

12.5 Colebrook-White Formula

The Colebrook-White formula:

 $1/sqrt(f) = 1.14 - 2 \log_{10} [e/D + 9.35/(Re x sqrt(f))]$

f = friction factor

e = internal roughness of pipe

D = internal diameter of pipe

Re = Reynolds number

Friction factors for turbulent flow calculated by Pipe Flow Gas Pressure Drop are based on the Colebrook-White formula.

The friction factor for Laminar flow is calculated from f = 64/Re

12.6 Friction Losses (Resistance to Flow)

Friction losses for incompressible flow (liquids) can be accurately calculated using the Darcy-Weisbach equation, and within specific criteria it can also be used for calculations with gases, however for has calculations within Pipe Flow application the friction losses are calculated using specific compressible flow equations as defined in the separate PDF document named 'Compressible Flow Equations'. This PDF is available from the 'Results Verification' menu inside the software.

12.7 Darcy-Weisbach Formula

For non-compressible fluids (liquids), fluid head resistance can be calculated by using the Darcy-Weisbach formula.

h fluid = $f(L/D) \times (v^2/2g)$

f = friction factorL = length of pipe workD = inner diameter of pipe workv = velocity of fluidg = acceleration due to gravity

This formula can be used for compressible (gas) calculations provided that the gas density at the start of the pipe is used to determine the fluid velocity, and provided that the pressure drop in the pipe is less than ten percent of the absolute pressure at the start condition.

For compressible (gas) calculations where the pressure drop is more than ten percent, but less than forty percent of the absolute pressure at the start of the pipe, the equation gives reasonable results provided that the gas density at the average pressure condition in the pipe is used to calculate the average velocity of the gas.

The Pipe Flow Gas Pressure Drop software however, does not allow use of the Darcy-Weisbach equation for compressible gas calculations since it uses the more accurate specialist compressible gas flow equations, which provide more accurate results, and which are not limited to working with pressure drops of up to a certain percentage of the initial start pressure.

12.8 Fitting Losses

The fluid head resistance through various pipe work fittings can be calculated if the 'K' factor of the fitting is known. Many manufacturers of pipe work fittings and valves publish 'K' factors for their products.

12.8.1 'K' Factor Fitting Head Loss Calculation for Liquids

For non-compressible (liquid) systems, fluid head loss through fittings and valves can be calculated from the following equation:

 $h_{fluid} = K' x v^2 / 2g$

 $\label{eq:K} \begin{array}{l} \mathsf{'K'} = \mathsf{manufacturer's \ published \ 'K' \ factor \ for \ the \ fitting \\ \mathsf{v} = \mathsf{velocity \ of \ fluid} \\ \mathsf{g} = \mathsf{acceleration \ due \ to \ gravity} \end{array}$

12.8.2 Equivalent Length Head Loss Calculation for Gases

For compressible gas flow calculations, the Pipe Flow Gas Pressure Drop software converts the 'K' factor of the fitting to an equivalent length of pipe, which will result in the same friction loss. This is done automatically during the calculation.

A 'K' factor can be converted to an equivalent length of pipe when the diameter of the pipe is known.

Equivalent length = (K factor * Diameter) / Friction factor

The Pipe Flow Gas Pressure Drop software allows fittings to be placed at both the start and the end of the pipe, and with compressible flow, when pressure loss occurs along the pipe, the gas will 'expand' (become less dense), hence it's velocity will increase, to maintain the same mass flow rate.

The 'K' factor method for calculating head loss across a fitting requires that the density of the fluid entering the fitting is known, since the result is a head loss that is relative to this density, and with a compressible gas flow calculation, where there are fittings at the start and end of the pipe, the density of the gas is different at these points. In addition, the starting pressure of a gas flow calculation affects the overall friction loss results (for the same flow rate) and therefore technically if there are fittings at the start of the pipe then the loss through these must be accounted for and the pressure immediately after the fittings would then need to be used as the start pressure for the friction loss calculation.

Using the equivalent length method for compressible gas flow calculations simplifies the problem. Once the overall loss through the pipe has been calculated (including the additional equivalent length for the fittings) then the amount of loss through the

fittings at the start and the end of the pipe can be apportioned appropriately to break out the results in to the fittings losses and the pipe friction loss.

12.8.3 Fittings Database

Pipe Flow Gas Pressure Drop has a database of valve and fittings 'K' factors and calculation helpers for:

- gradual enlargements
- gradual contractions
- sudden enlargements
- sudden contractions
- rounded entrances
- long pipe bends

In systems where pipe lengths are relatively long, the effect of the fitting losses for bends may be minor (in comparison to the long pipe friction losses) and in these cases, fitting losses are sometimes ignored during initial assessment of the system.

If a partially open valve is part of the design, the effect of the valve should always be considered as the valve loss may be large.

12.9 Compressible Gas Flow Equations

Friction loss for a compressible fluid, such as a gas, needs to account for the change in density, as the gas moves along the pipe and loss of pressure occurs. When using the compressible flow calculation engine Pipe Flow Gas Pressure Drop can be set to use one of the following compressible flow equations:

- General Fundamental Isothermal Flow Equation
- Complete Isothermal Flow Equation
- AGA Isothermal Flow Equation
- Weymouth Isothermal Flow Equation
- Panhandle A Isothermal Flow Equation
- Panhandle B Isothermal Flow Equation
- IGT Isothermal Flow Equation

The formula for each of the above equations is detailed in a separate PDF document named 'Compressible Flow Equations'. This PDF is available from the 'Results Verification' menu inside the Pipe Flow Gas Pressure Drop software.

Term	Description
Absolute Pressure	Pressure measured with respect to zero pressure.
Atmosphere	A standard atmospheric pressure of 1.01325 bar a or 14.696 psi a.
Centipoise	Absolute viscosity of a fluid expressed in Pa \cdot s x 10 ⁻³
Centistokes	Kinematic viscosity of a fluid expressed in m ² /s x 10 ⁻⁶
Colebrook-White equation	An equation used to calculate accurate friction factors from the internal diameter and internal roughness of a pipe and the Reynolds number for the flow conditions.
Darcy-Weisbach equation	An equation used to calculate the frictional head loss due to fluid flow from the friction factor, the length and diameter of the pipe, the velocity of the fluid and the gravitational constant.
Friction Factor	A factor to be used in the Darcy-Weisbach equation. Either calculated from the Colebrook-White equation or ready from the Moody diagram.
Entry Pressure	The pressure at the start of the pipe.
Exit Pressure	The pressure at the end of the pipe.
Fixed Pressure Loss	A static pressure loss which is independent of the flow rate.
K Value	Coefficient of frictional loss through a valve or pipe fitting.
Moody Diagram	A graphical representation of the relationship between Reynolds number, relative roughness and Friction factor.
Pressure Loss	The friction loss due to fluid flow expressed in a relative fluid head or a non-relative unit of pressure.
Reynolds Number	A dimensionless number derived from the fluid velocity, the internal diameter of the pipe and the Kinematic viscosity of the fluid.

Viscosity

A measure of a fluid's resistance to flow.
